Problem description:

Hand pose estimation plays an important role in human-robot interaction tasks, such as gesture recognition and learning grasping capability by human demonstration. Since emergence of consumer level depth sensing device, a lot of depth image based hand pose estimation methods appeared. One of the hand pose estimation approach relies on the kinematic model of human hand. Relying on an efficient sphere-based likelihood function [1], hand pose can be tracked in real-time using Particle Swarm Optimization method.

In this Forschungspraxis, the student should use the sphere based likelihood function from [1], and implement the hybrid PSO-ICP method [1] from using a public dataset [2].

Work schedule:

- Literature study
- Implementation of the hybrid PSO-ICP method [1]
- Evaluation of the implementation on a public dataset [2].
